Skeleton Key for RNAseq analysis

Written By: Ciera Martinez

See README.md for more detailed instructions of how to use script

Analysis

libraries

```
library(edgeR)
library(yaml)
```

Read in YAML guide

```
yamls <- yaml.load_file("de.yml")
```

This part assigns your YMAL to a object in R. This will be used throughout the script to specify which sample types you are comparing.

```
sample1 <- yamls$sample1
sample2 <- yamls$sample2

sample1
```

```
## [1] "tf2bmbr"
```

```
sample2
```

```
## [1] "tf2cmbr"
```

Read in Data

Read in raw count data per gene.

```
counts <- read.delim("../requisiteData/sam2countsResults.tsv",row.names=1)

#check the file
head(counts)
colnames(counts)
#need to convert NA to 0 counts
counts[is.na(counts)] <- 0
```

Subset DE expirement

Start by subsetting the particular treatments which are being compared.

```
colnames(counts)
```

```
##  [1] "tf2ambr1"      "tf2ambr3"      "tf2ambr4"      "tf2ambr6"

```

Add column specifying library Group

Make a vector called group that will be used to make a new column named group to identify library region type.

```
group <- c(rep(sample1, count1Len), rep(sample2, count2Len))
d <- DGEList(counts=counts,group=group)
```

Check to see if the group column matches your sample name and they are appropriate.

```
d$samples
```

```
##              group lib.size norm.factors
## tf2bmbr2   tf2bmbr   189160            1
## tf2bmbr5   tf2bmbr   727355            1
## tf2bmbr6   tf2bmbr  1244342            1
## tf2cmbr1.4 tf2cmbr   443572            1
## tf2cmbr3   tf2cmbr  1337575            1
## tf2cmbr6   tf2cmbr   790129            1
## tf2cmbr7   tf2cmbr   832907            1
```

Differential expression using edgeR

Make sure there is full understanding on each edgeR command being used. The manual is amazing so read it *before* running the DE analysis below edgeR manual.

```
cpm.d <- cpm(d) #counts per mutant
d <- d[rowSums(cpm.d>5)>=3,] #This might be a line to adjust. It is removing genes with low counts.
d <- estimateCommonDisp(d,verbose=T)
```

```
## Disp = 0.9839 , BCV = 0.9919
```

```
d <- calcNormFactors(d)
d <- estimateCommonDisp(d)

DEtest <- exactTest(d,pair=c(sample1,sample2))
head(DEtest$table)
```

```
##                       logFC logCPM    PValue
## Solyc00g005050.2.1  1.1020  3.696 3.130e-01
## Solyc00g005070.1.1 -5.6801  8.769 1.751e-06
## Solyc00g005080.1.1 -0.8352  4.963 4.167e-01
## Solyc00g005440.1.1  0.3470  4.291 6.839e-01
## Solyc00g005840.2.1  0.6277  4.389 5.323e-01
## Solyc00g005880.1.1 -5.3972  7.394 6.301e-06
```

```
results <- topTags(DEtest, n=Inf)
head(results)
```

```
## Comparison of groups:  tf2cmbr-tf2bmbr
##                      logFC logCPM    PValue       FDR
## Solyc00g020010.1.1 -9.696 11.110 2.613e-12 3.735e-08
## Solyc01g112310.2.1 -9.633  9.786 5.703e-12 4.076e-08
## Solyc12g098780.1.1 -9.218  9.793 1.541e-11 7.345e-08
## Solyc03g033830.2.1 -9.180  9.780 2.490e-11 8.899e-08
## Solyc01g068170.2.1 -8.708  9.624 8.965e-11 2.238e-07
## Solyc09g055810.1.1 -8.594  9.780 1.041e-10 2.238e-07
```

```r
dim(results$table)
```

```
## [1] 14296     4
```

```r
sum(results$table$FDR<.05) # How many are DE genes?
```

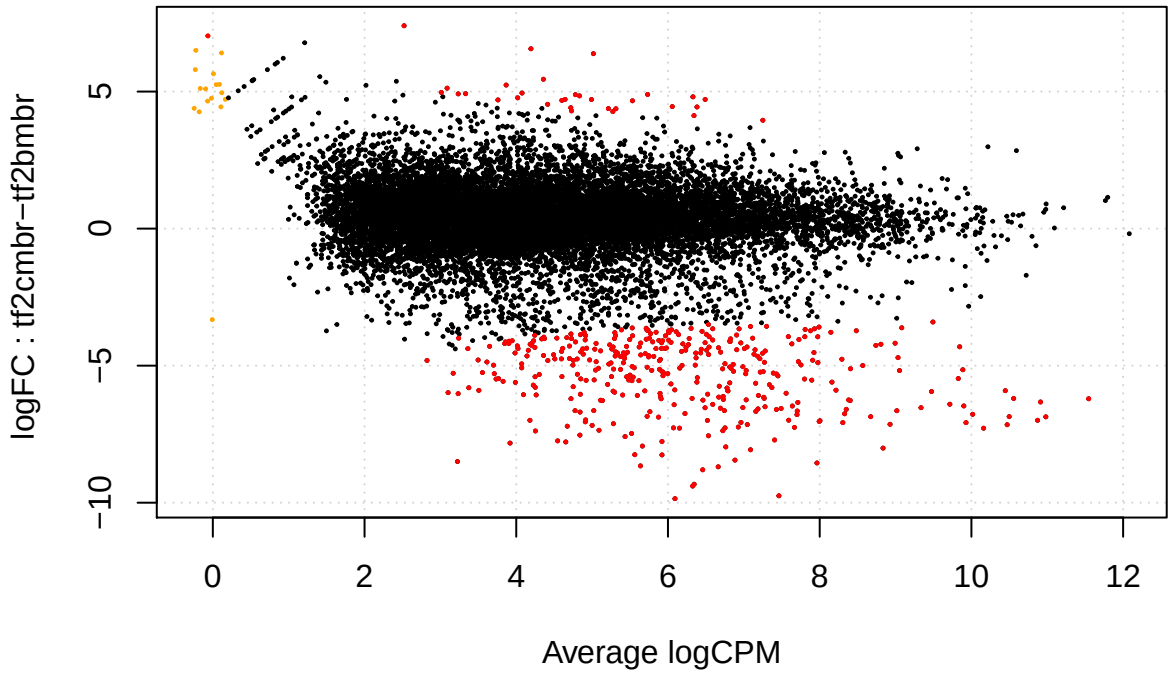
```
## [1] 406
```

```r
summary(decideTestsDGE(DEtest,p.value=.05))
```

```
##    [,1]
## -1   374
## 0  13890
## 1     32
```

```r
sig.genes <- rownames(results$table[results$table$FDR<0.05,]) # outputs just significant gene names

plotSmear(d,de.tags=sig.genes)
```



Subset by all the genes with a significant FDR score.

```r
results.sig <- subset(results$table, results$table$FDR < 0.05)
```

What are the genes that are misexpressed? For this we need to add some annotation.

Essentially we are merging two annotations files to 1.) only sig genes 2.) all genes

```
annotation1<- read.delim("../requisiteData/ITAG2.3_all_Arabidopsis_ITAG_annotations.tsv", header=FALSE)
colnames(annotation1) <- c("ITAG", "SGN_annotation")
annotation2<- read.delim ("../requisiteData/ITAG2.3_all_Arabidopsis_annotated.tsv")
annotation <- merge(annotation1,annotation2, by = "ITAG")

#Making the only significant gene table
results.sig$ITAG <- rownames(results.sig)  #change row.names to ITAG for merging
results.sig.annotated <- merge(results.sig,annotation,by = "ITAG") #This is merging to only sig genes

#Making all table

results$table$ITAG <- rownames(results$table)
results.all.annotated <- merge(results$table, annotation,by = "ITAG")
```

Write table with results.

```
write.table(results.all.annotated, file=paste(sample1,"_",sample2,"_","DE_all.txt",sep=""),sep="\t",row
write.table(results.sig.annotated, file=paste(sample1,"_",sample2,"_","DE_sig.txt",sep=""),sep="\t",row
```

Now run the script below for a full `knitr` report of what was run and leave this report in the folder that the analysis was done with output files.

```
library(rmarkdown)
render("skeletonDE.Rmd", "pdf_document", output_file = paste(sample1,"_",sample2,"_","DE.pdf",sep=""))
```
