

# Skeleton Key for RNAseq analysis

*Written By: Ciera Martinez*

*See README.md for more detailed instructions of how to use script*

Run the `render()` function below and everything will be run with report at end.

```
library(rmarkdown)
render("skeletonDE.Rmd", "pdf_document", output_file = paste(sample1,"_",sample2,"_", "DE.pdf", sep=""))
```

## Analysis (Aucutal start)

libraries

```
library(edgeR)
library(yaml)
```

## Read in YAML guide

This reads in the information in the `de.yml` file which has the two names of the samples you are interested in comparing.

```
yamls <- yaml.load_file("de.yml")
```

This part assigns your YMAL to a object in R. This will be used throughout the script to specify which sample types you are comparing.

```
sample1 <- yamls$sample1
sample2 <- yamls$sample2

sample1
```

```
## [1] "wtbother"
```

```
sample2
```

```
## [1] "wtcother"
```

## Read in Data

Read in raw count data per gene.

```
counts <- read.delim("../requisiteData/sam2countsResults.tsv",row.names=1)

#check the file
head(counts)
colnames(counts)
#need to convert NA to 0 counts
counts[is.na(counts)] <- 0
```

## Subset DE expirement

Start by subsetting the particular treatments which are being compared. This might need to be modified depending on the naming of your samples. In my case each sample is named by sample and rep number, so the script is identifying any sample with the sample name given in the de.yml file.

```
colnames(counts)

## [1] "tf2ambr1"      "tf2ambr3"      "tf2ambr4"      "tf2ambr6"
## [5] "tf2aothier1"   "tf2aothier2"   "tf2aothier4"   "tf2aothier7"

```

## Add column specifying library Group

Make a vector called group that will be used to make a new column named group to identify library region type.

```
group <- c(rep(sample1, count1Len), rep(sample2, count2Len))
d <- DGEList(counts=counts,group=group)
```

Check to see if the group column matches your sample name and they are appropriate.

```
d$samples
```

```
##           group lib.size norm.factors
## wtbother1.4  wtbother   1421          1
## wtbother3    wtbother 1076939          1
## wtbother5    wtbother  200587          1
## wtbother8    wtbother  499487          1
## wtcother1.3.4 wtcother  197345          1
## wtcother2    wtcother  319043          1
## wtcother6    wtcother 1525172          1
```

## Differential expression using edgeR

Make sure there is full understanding of each edgeR command being used. The manual is amazing so read it *before* running the DE analysis below [edgeR manual](#). There are many options and they must be set to be appropriate for your analysis.

```
cpm.d <- cpm(d) #counts per mutant
d <- d[rowSums(cpm.d>5)>=3,] #This might be a line to adjust. It is removing genes with low counts.
d <- estimateCommonDisp(d,verbose=T)
```

```
## Disp = 0.6785 , BCV = 0.8237
```

```
d <- calcNormFactors(d)
d <- estimateCommonDisp(d)

DEtest <- exactTest(d,pair=c(sample1,sample2))
head(DEtest$table)
```

```

##  0    14682
##  1       55
```

```
sig.genes <- rownames(results$table[results$table$FDR<0.05,]) # outputs just significant gene names
plotSmea(d,de.tags=sig.genes)
```

Subset all the genes with a significant FDR score less than .05.

```
results.sig <- subset(results$table, results$table$FDR < 0.05)
```

```
dim(results.sig)
```

What are the genes that are misexpressed? For this we need to add some annotation.

Essentially we are merging two annotations files to 1.) only sig genes 2.) all genes

```
annotation1<- read.delim("../requisiteData/ITAG2.3_all_Arabidopsis_ITAG_annotations.tsv", header=FALSE)
colnames(annotation1) <- c("ITAG", "SGN_annotation")
annotation2<- read.delim ("../requisiteData/ITAG2.3_all_Arabidopsis_annotated.tsv")
annotation <- merge(annotation1,annotation2, by = "ITAG")
head(annotation)
```

```

results.all.annotated <- merge(results$table, annotation,by = "ITAG")
```

Write table with results.

```
write.table(results.all.annotated, file=paste(sample1,"_",sample2,"_", "DE_all.txt",sep=""),sep="\t",row  
write.table(results.sig.annotated, file=paste(sample1,"_",sample2,"_", "DE_sig.txt",sep=""),sep="\t",row
```

Now run the script below for a full knitr report of what was run and leave this report in the folder that the analysis was done with output files.
