

Skeleton Key for RNAseq analysis

Written By: Ciera Martinez

About

This is the script used to perform differential gene expression analysis using **edgeR**. The tissue came from p4 leaves of *Solanum lycopersicum* using Laser Capture Microdissection.

Key to Samples

genotype: either wildtype of *tf2*

region: A. tip B. early emerging leaflet C. base

type: MBR = Marginal Blastozone Region, other = the rachis or midvein region

Samples:

```
print(sample1)
```

```
## [1] "tf2aother"
```

```
print(sample2)
```

```
## [1] "tf2cother"
```

See README.md for more detailed instructions of how to use script

Run the **render()** function below and everything will be run with report at end.

```
library(rmarkdown)
render("skeletonDE.Rmd", "pdf_document", output_file = paste(sample1,"_",sample2,"_", "DE.pdf",sep=""))
```

Analysis (Acutal start)

libraries

```
library(edgeR)
library(yaml)
```

Read in YAML guide

This reads in the information in the **de.yaml** file which has the two names of the samples you are interested in comparing.

```
yamls <- yaml.load_file("de.yml")
```

This part assigns your YMAL to a object in R. This will be used throughout the script to specify which sample types you are comparing.

```
sample1 <- yamls$sample1
sample2 <- yamls$sample2

sample1
```

```
## [1] "tf2aother"
```

```
sample2
```

```
## [1] "tf2bother"
```

Read in Data

Read in raw count data per gene.

```
counts <- read.delim("../requisiteData/sam2countsResults.tsv",row.names=1)

#check the file
head(counts)
colnames(counts)
#need to convert NA to 0 counts
counts[is.na(counts)] <- 0
```

Subset DE expirement

Start by subsetting the particular treatments which are being compared. This might need to be modified depending on the naming of your samples. In my case each sample is named by sample and rep number, so the script is identifying any sample with the sample name given in the de.yml file.

```
colnames(counts)
```

```
## [1] "tf2ambr1"      "tf2ambr3"      "tf2ambr4"      "tf2ambr6"

```

Add column specifying library Group

Make a vector called group that will be used to make a new column named group to identify library region type.

```
group <- c(rep(sample1, count1Len), rep(sample2, count2Len))
d <- DGEList(counts=counts,group=group)
```

Check to see if the group column matches your sample name and they are appropriate.

```
d$samples
```

```
##                group lib.size norm.factors
## tf2aother1 tf2aother  263117         1
## tf2aother2 tf2aother  698710         1
## tf2aother4 tf2aother  792325         1
## tf2aother7 tf2aother  142504         1
## tf2bother1 tf2bother  2415227         1
## tf2bother3 tf2bother   626786         1
## tf2bother4 tf2bother  1003586         1
## tf2bother6 tf2bother   854903         1
```

Differential expression using edgeR

Make sure there is full understanding of each edgeR command being used. The manual is amazing so read it *before* running the DE analysis below [edgeR manual](#). There are many options and they must be set to be appropriate for your analysis.

```
cpm.d <- cpm(d) #counts per mutant
d <- d[rowSums(cpm.d>5)>=3,] #This might be a line to adjust. It is removing genes with low counts.
d <- estimateCommonDisp(d,verbose=T)
```

```
## Disp = 0.3454 , BCV = 0.5877
```

```
d <- calcNormFactors(d)
d <- estimateCommonDisp(d)

DEtest <- exactTest(d,pair=c(sample1,sample2))
head(DEtest$table)
```

```
##               logFC logCPM  PValue

```

```
dim(results$table)
```

```
## [1] 15096      4
```

```
sum(results$table$FDR<.05) # How many are DE genes?
```

```
## [1] 481
```

```
summary(decideTestsDGE(DEtest,p.value=.05))
```

```
##      [,1]
## -1     290
##  0    14615
##  1     191
```

```
sig.genes <- rownames(results$table[results$table$FDR<0.05,]) # outputs just significant gene names
plotSmea(d,de.tags=sig.genes)
```

Subset all the genes with a significant FDR score less than .05.

```
results.sig <- subset(results$table, results$table$FDR < 0.05)
```

```
dim(results.sig)
```

What are the genes that are misexpressed? For this we need to add some annotation.

Essentially we are merging two annotations files to 1.) only sig genes 2.) all genes

```
annotation1<- read.delim("../requisiteData/ITAG2.3_all_Arabidopsis_ITAG_annotations.tsv", header=FALSE)
colnames(annotation1) <- c("ITAG", "SGN_annotation")
annotation2<- read.delim("../requisiteData/ITAG2.3_all_Arabidopsis_annotated.tsv")
annotation <- merge(annotation1,annotation2, by = "ITAG")
head(annotation)
```

```
##          ITAG

```

#Making the only significant gene table
results.sig$ITAG <- rownames(results.sig) #change row.names to ITAG for merging
results.sig.annotated <- merge(results.sig,annotation,by = "ITAG", all.x=TRUE) #This is merging only si

#Making all table

results$table$ITAG <- rownames(results$table)
results.all.annotated <- merge(results$table, annotation,by = "ITAG")

```

Write table with results.

```

write.table(results.all.annotated, file=paste(sample1,"_",sample2,"_", "DE_all.txt",sep=""),sep="\t",row
write.table(results.sig.annotated, file=paste(sample1,"_",sample2,"_", "DE_sig.txt",sep=""),sep="\t",row

```

Now run the script below for a full knitr report of what was run and leave this report in the folder that the analysis was done with output files.
